

External Alarms for Biolytix

Many Biolytix owners in WA have remote telemetry alarms. Unfortunately with the demise of Biolytix in Queensland, messages of faults just don't get sent. It is important that you have an active alarm to activate if either the pump or the blower fails.

We can now offer our clients an external alarm plate, mounted on a pole near the tank. It is also possible to place the alarm plate inside the house but this would cost a lot more.

New pole with alarm plate.

Audio-visual alarm – neon light, buzzer, with a switch to isolate buzzer noise until problem is sorted.

What has to happen

The telemetry apparatus is completely disconnected and removed. New wiring of the junction terminal box, alarm float, pressure switch device and blower is undertaken, and then the alarm lead is passed through the control box and valve box as required, and fixed to the pole.

The alarm plate is mounted in a weatherproof box to protect it, but still enable visual inspection. The buzzer is loud enough to hear in the garden area and from the house. The neon light, while reasonably bright, is far easier to see at night.

We can completely install this for \$350, provided the work is undertaken while servicing (and we are aware you require) or within 30 km of Mundaring. Properties further away will incur a travel charge. Please contact the office about this.
